

Supporting Net Neutrality Regulations and title two or similar status of internet service providers for that purpose.

I am a master bio engineer and politically moderate citizen that wholeheartedly wants regulations in place to maintain net neutrality. As a regular user of the internet, I already have to make certain difficult decisions about the validity of the information provided when searching, without having to worry about whether the information I am actively seeking has been obscured by the internet host or provider.

Service providers could easily target races, political affiliations that don't agree with policies that are beneficial to the isp.

ISPs could also engage in anticompetitive behavior by throttling businesses and products that compete or businesses that provide services to competitors.

Isps could emerge that provide cheap or free internet, which would compete with existing models by selling throttling rights. There by creating a race to the bottom, which evidently large isps don't find threatening or have not conceived of since they have in general been supportive of losing a neutral internet.

For these reason, and many others I believe in leaving the legal status of isps in title 2 and believe in upholding any and all regulations which make the internet open and neutral.

Additionally, if an opportunity ever arises, I support a constitutional amendment that says as such, for I strongly believe that neutral access to the internet should be held in as high esteem as that is of the inalienable right of free speech of all men/women and the freedom of our press; for the loss of net neutrality could serve the same purposes as silencing the many using the pocket book of the few.
